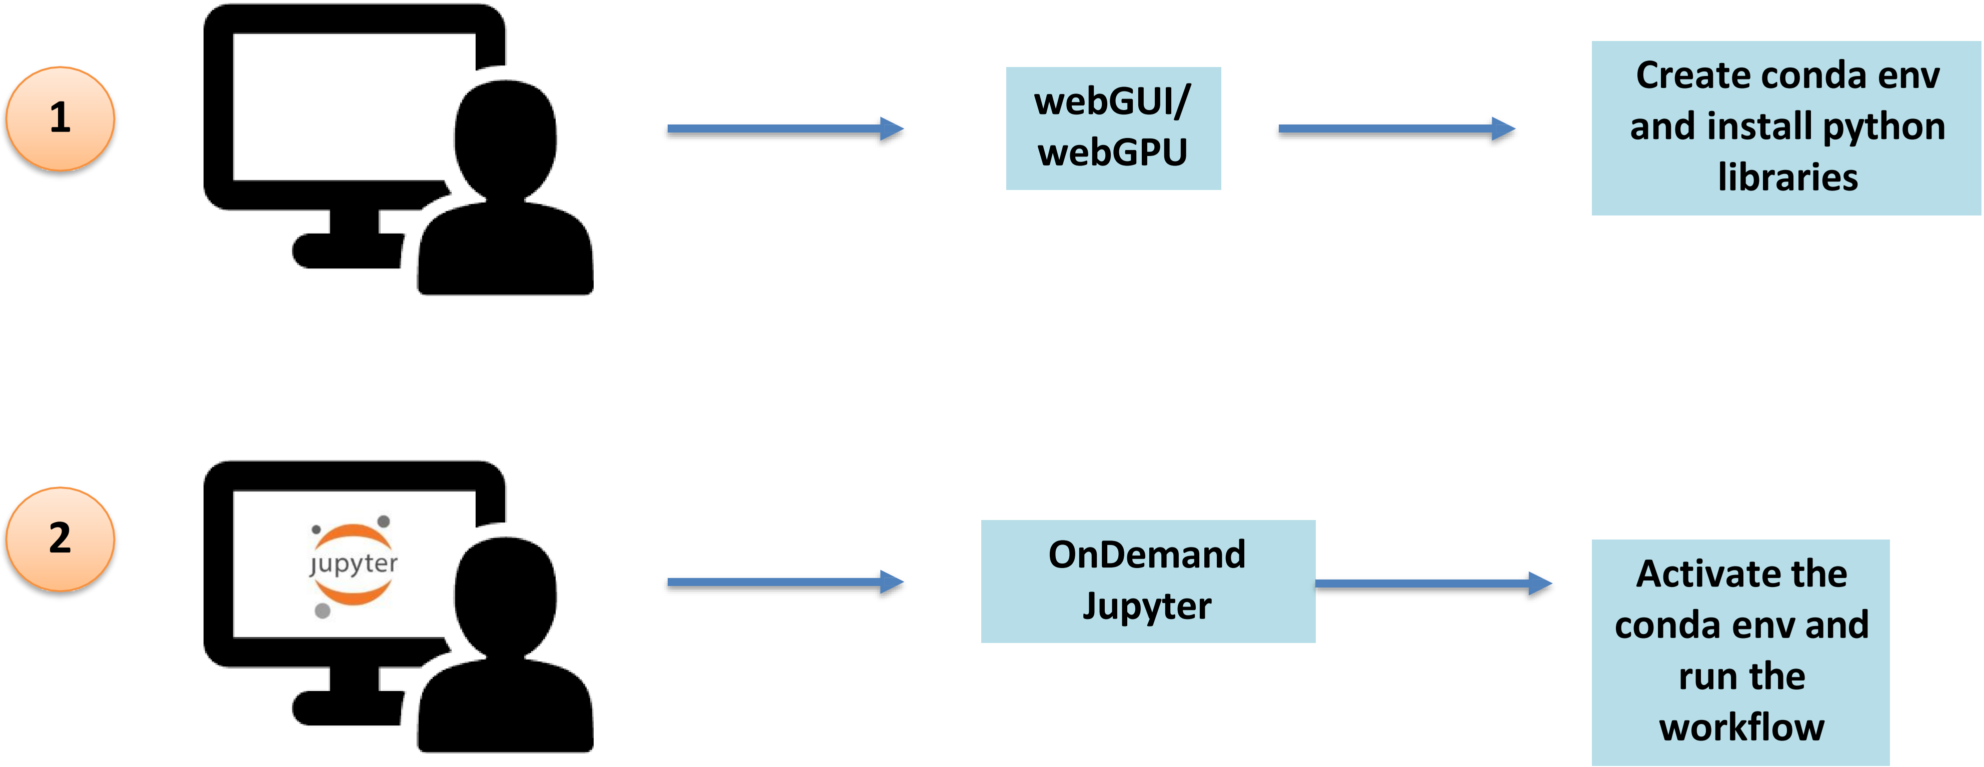
# Python image processing workflows



1
webGUI/ webGPU
Create conda env and install python libraries
2
jupyter
OnDemand Jupyter
Activate the conda env and run the workflow

https://portal.biohpc.swmed.edu/media/filer_public/18/86/18864d7a-28ca-4ae5-be84-3e94b7c3bc4b/software_installation_2023_09_13.pdf

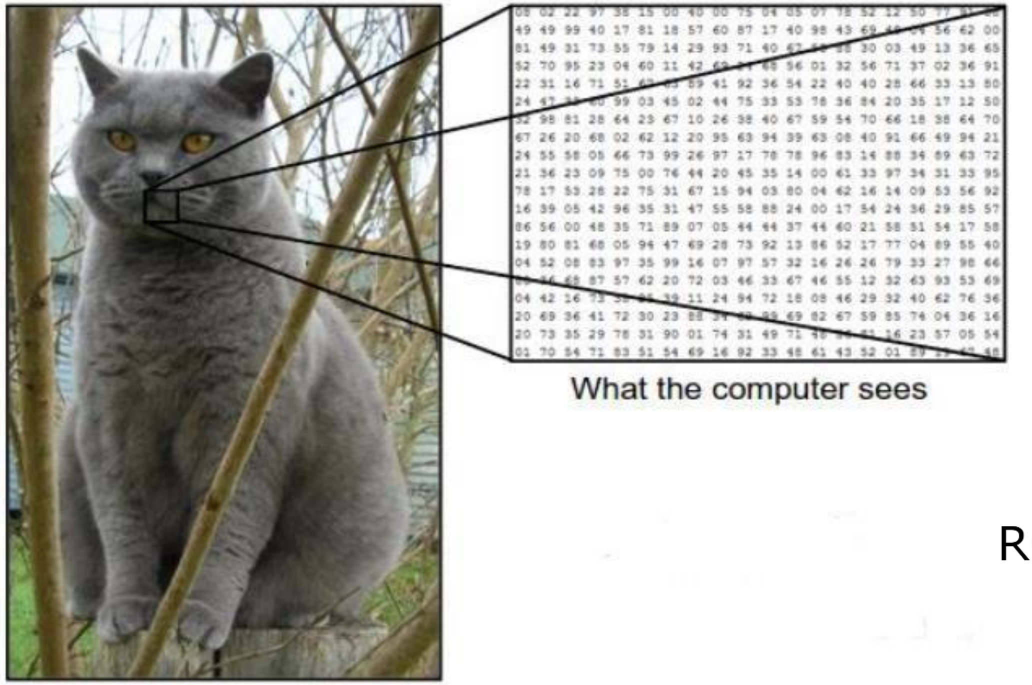
# Python Libraries + Modules used in this training

**Docs:**

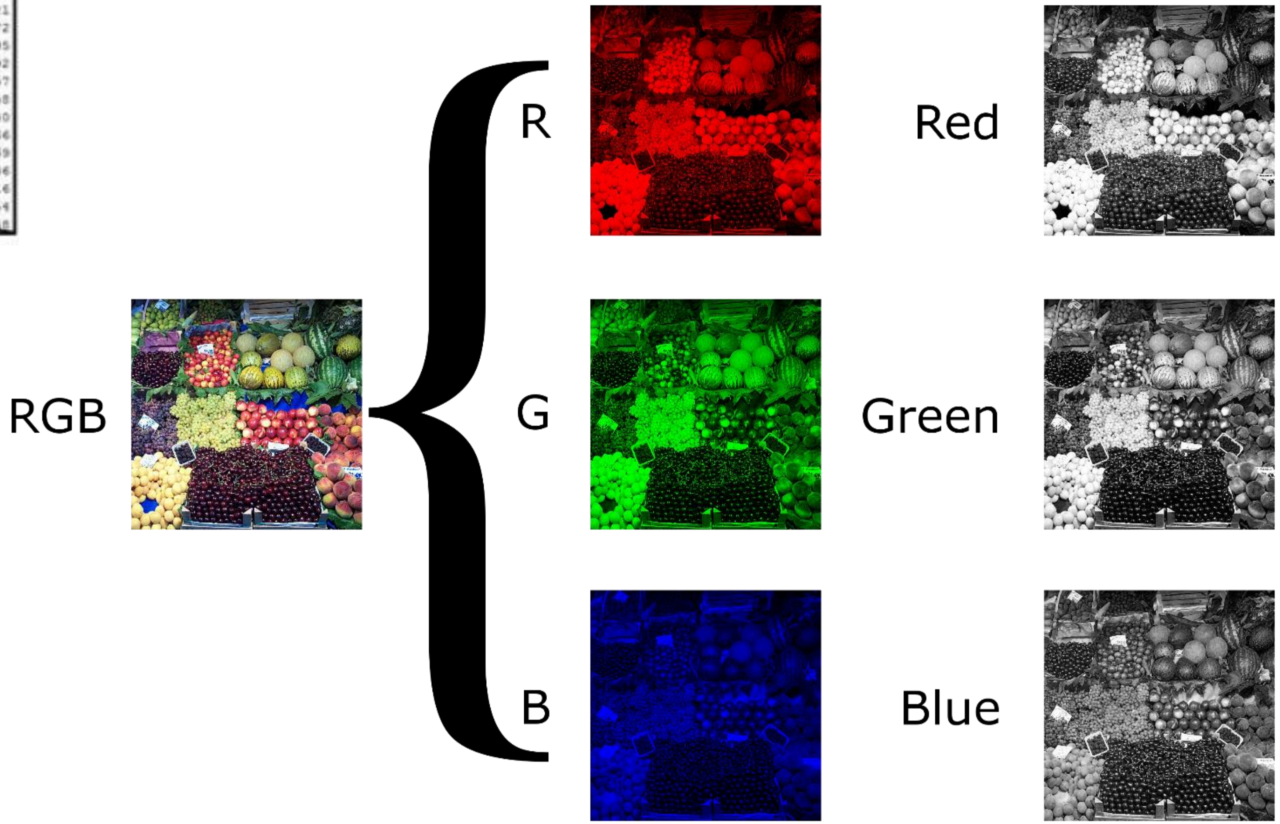
- os : https://docs.python.org/3/library/os.html
- matplotlib : https://matplotlib.org/
- scipy :
  - General : https://docs.scipy.org
  - ndimage : https://docs.scipy.org/doc/scipy/reference/ndimage.html
- skimage : https://scikit-image.org/
- sklearn : https://scikit-learn.org/stable/
- numpy :
  - General : https://numpy.org/doc/stable/index.html
  - ndarrays : https://numpy.org/doc/stable/reference/arrays.ndarray.html#id1

**Already installed in Jupyter/JupyterLab OnDemand.**

# How a digital image is stored on a computer



What the computer sees



Source - http://cs231n.github.io/

# Images as Arrays

**Different Python libraries have different array implementations**

- array
- **numpy**
  - ndarray
- **openCV**
  - cv::Mat

**Common data types for image pixels:**

- **bool** (binary)- [0,1]
- **int8** (signed integer 8 bit) – numbers in the range: [-128 : 127]
- **float** (double-precision floating point) – Decimal numbers (e.g. 2.2251e-308, 0.4, 0.33...)
- **uint8** (unsigned 8-bit) – [0,255]
- **uint16** (unsigned 16-bit) – [0,65535]

# Python Array Indexing

- Python starts counting indexes from 0, and arranges coordinates like C does (row-major)
- Array elements can be access in two ways:
  - By forward indexing
  - By backward indexing

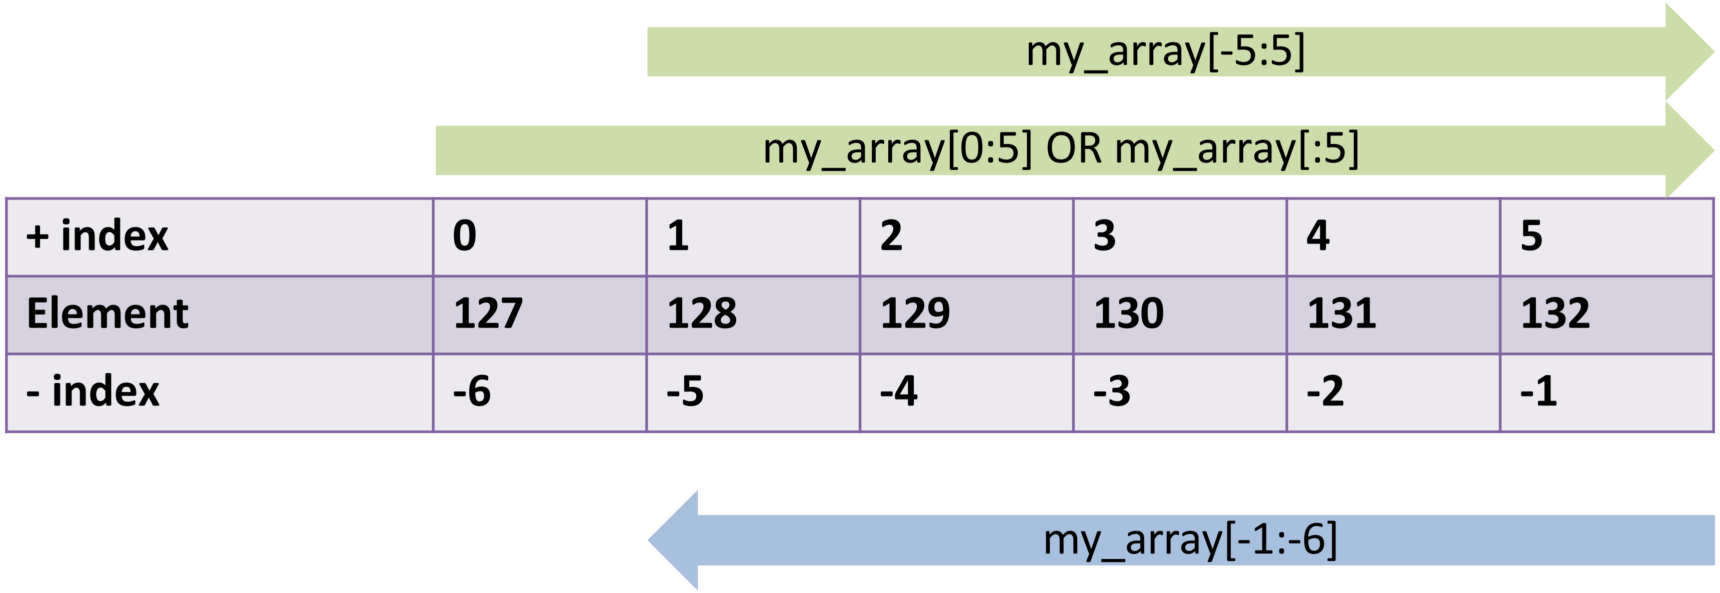
```
my_array = numpy.array([127, 128, 129, 130, 131, 132], dtype=np.int8)
```

| + index | 0 | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|---|
| Element | 127 | 128 | 129 | 130 | 131 | 132 |
| - index | -6 | -5 | -4 | -3 | -2 | -1 |

**Slice indexes are defined by [Start:Stop] or [Start:Stop:Step] (Stop not included)**

# Python Array Indexing

```
my_array = numpy.array([127, 128, 129, 130, 131, 132], dtype=np.int8)
```



my_array[-5:5]

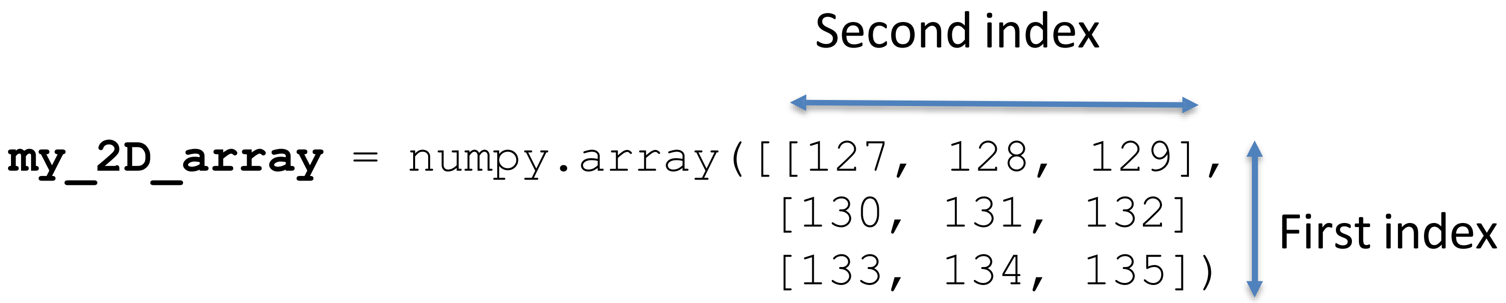
my_array[0:5] OR my_array[:5]

| + index | 0 | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|---|
| Element | 127 | 128 | 129 | 130 | 131 | 132 |
| - index | -6 | -5 | -4 | -3 | -2 | -1 |

my_array[-1:-6]

# Multi-dimensional arrays – numpy arrays

Python counts in ‘row-major’ ordering, and orders dimensions like C does.
- Multidimensional arrays are ‘lists of lists’
- This is in fact how elements are stored in memory



Second index

```
my_2D_array = numpy.array([[127, 128, 129],
                           [130, 131, 132]
                           [133, 134, 135]])
```

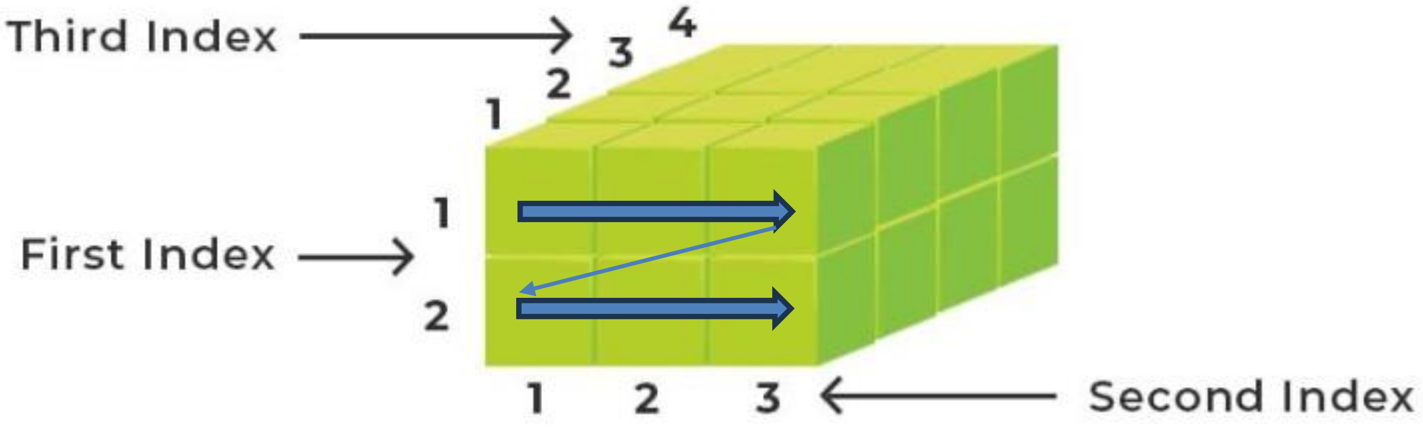
First index

```
my_2D_array[1][0:1] = [130, 131]
my_2D_array[-1][:] = [133, 134, 135]
```

# Multi-dimensional arrays – numpy arrays

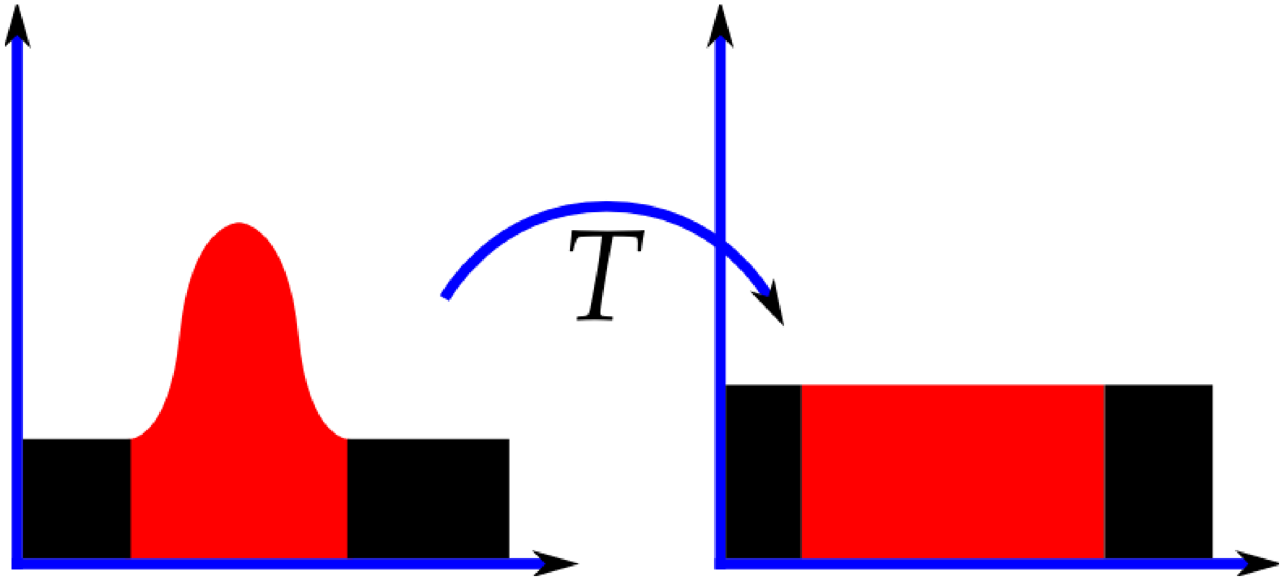
Python counts in ‘row-major’ ordering, and orders dimensions like C does.

- Multidimensional arrays are ‘lists of lists’
- This is in fact how elements are stored in memory



# Intensity enhancement

- Contrast stretching
- Histogram equalization
- Adaptive equalization

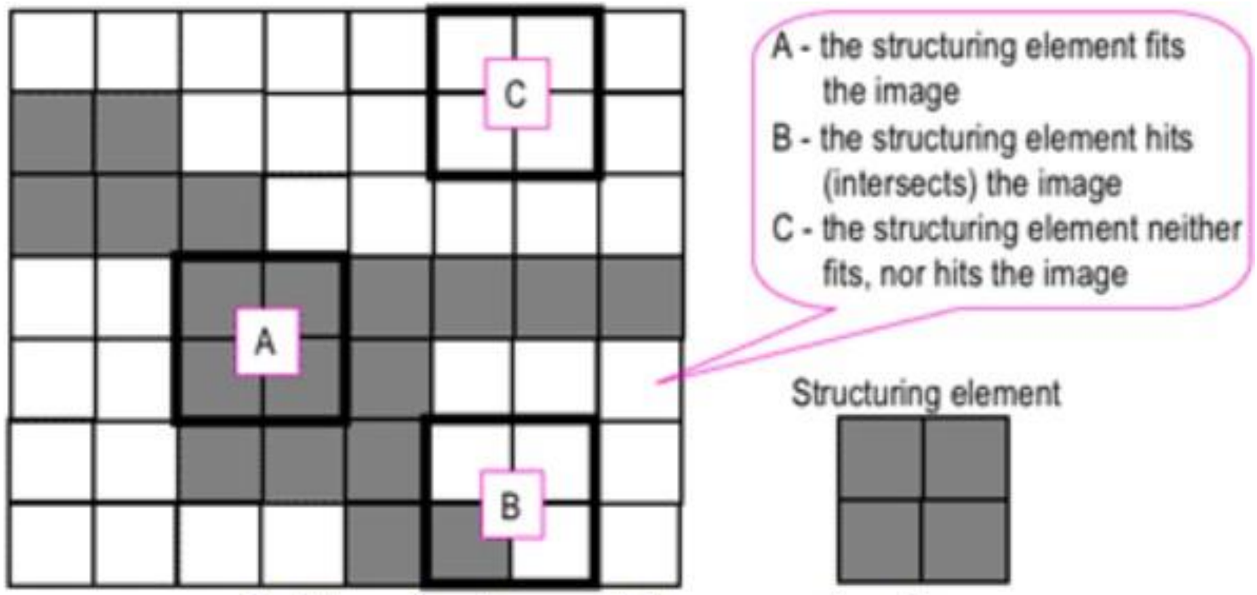


https://en.wikipedia.org/wiki/Histogram_equalization

# Morphological operations: Structuring element

The structuring element is a small binary image or matrix such that:

- The matrix dimensions specify the size of the structuring element.
- The pattern of ones and zeros specifies the shape of the structuring element.



C
A
B
A - the structuring element fits the image
B - the structuring element hits (intersects) the image
C - the structuring element neither fits, nor hits the image
Structuring element

Probing of an image with a structuring element
(white and grey pixels have zero and non-zero values, respectively).

https://www.cs.auckland.ac.nz/courses/compsci773s1c/lectures/ImageProcessing-html/topic4.htm

# Mathematical Morphology - Grayscale

- Grayscale images can be treated similarly, but with a slightly modified interpretation of ‘hit or miss’
- Dilation will result in a pixel taking on the max value defined by the moving window of the strel.
- Erosion will result in a pixel taking on the min value defined by the moving window of the strel.

# Morphological operations: Dilation and Erosion

**Erosion**:

- Opening an image smoothes its contour, fractures narrow isthmuses, making items more separated
- Closing fills in small gaps/holes and brings items closer, also smoothes the contour

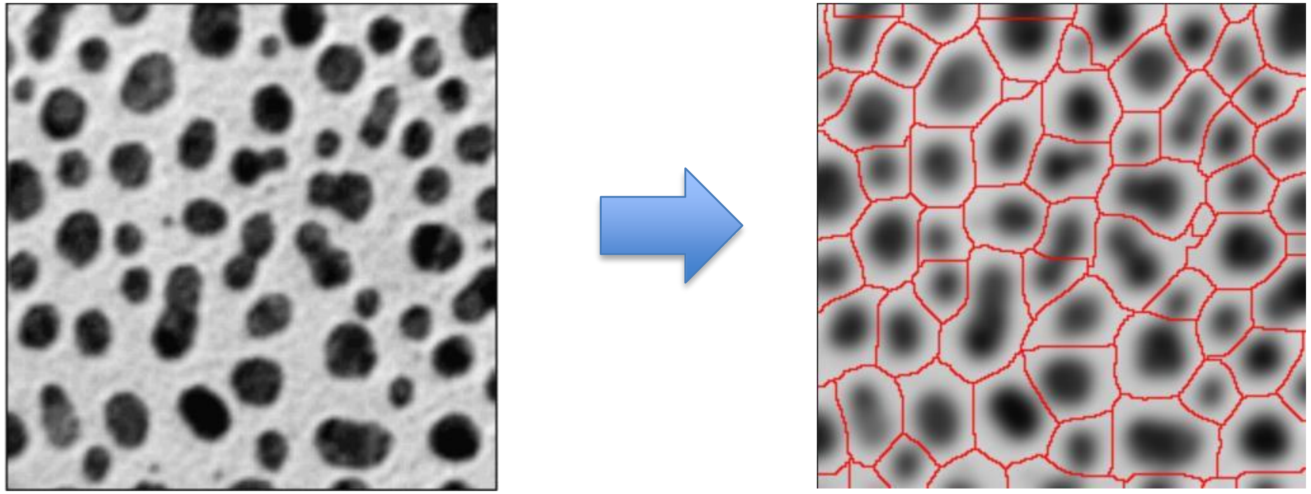
# Segmentation – Separating an image into parts

Most basic: Manual thresholding

- Bright or dark background with a dark or bright foreground, respectively.
- Choose a cutoff value, threshold.
- Using global thresholds may miss important elements

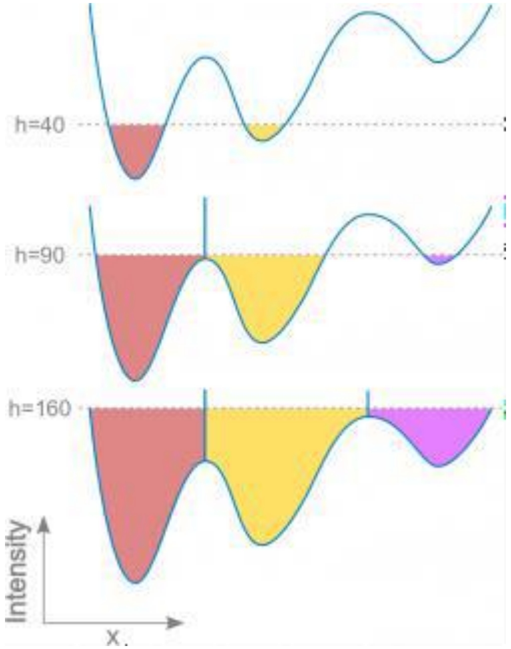
More complex:

- Adaptive thresholds
- Morphological segmentation
- Clustering
- Machine learning methods



# Morphological Segmentation: Watershed method

- Consider grey levels as altitudes
- Identify local minima
- Flood basins starting from minima
- Separate the basins by a “dam” → the watershed



**Steps for performing the watershed method:**

1. Segment objects of interest
2. Convert the mask into an intensity profile using the distance transform
3. Run the watershed algorithm

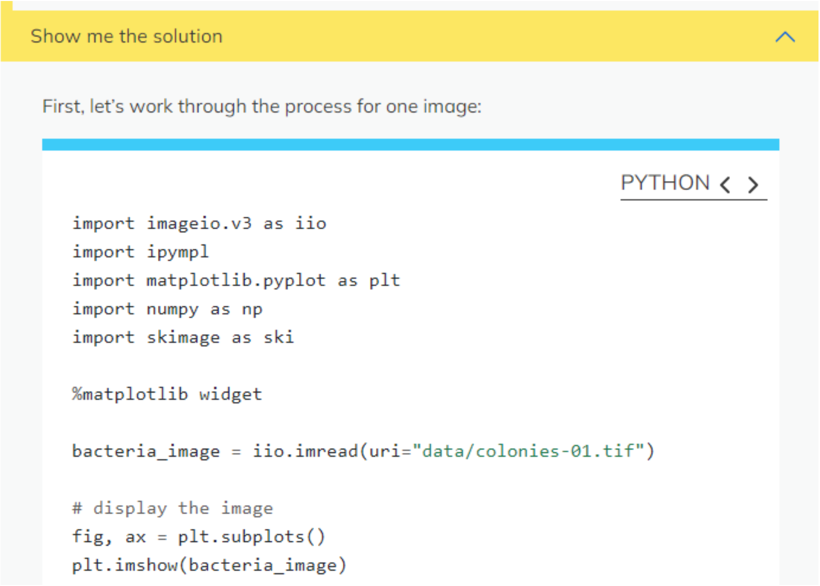
## Grayscale Histograms

We will start with grayscale images, and then move on to colour images. We will use this image of a plant seedling as an example:



First, let's work through the process for one image:

```
import imageio.v3 as iio
import ipympl
import matplotlib.pyplot as plt
import numpy as np
import skimage as ski

%matplotlib widget

bacteria_image = iio.imread(uri="data/colonies-01.tif")

# display the image
fig, ax = plt.subplots()
plt.imshow(bacteria_image)
```
